Speaker: Simon Rowell

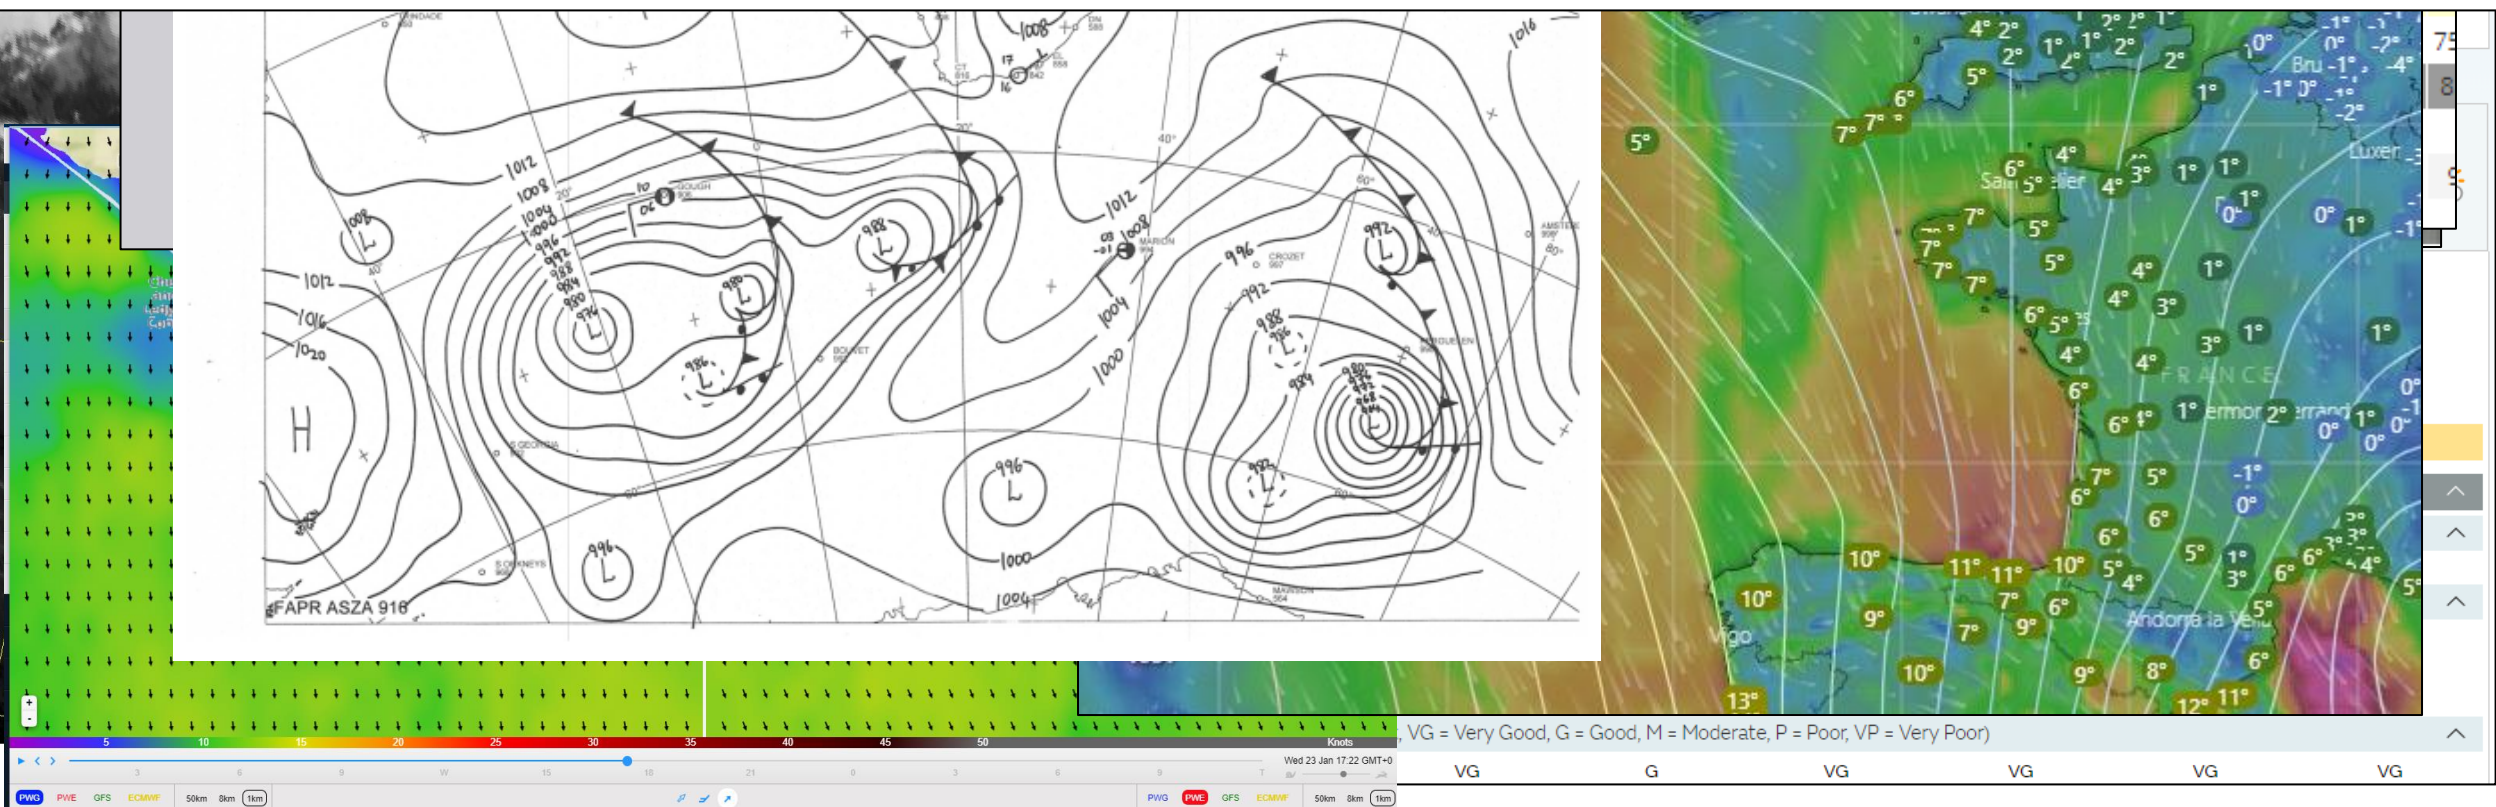

Forecasting from Ocean scale to Sub-Grid

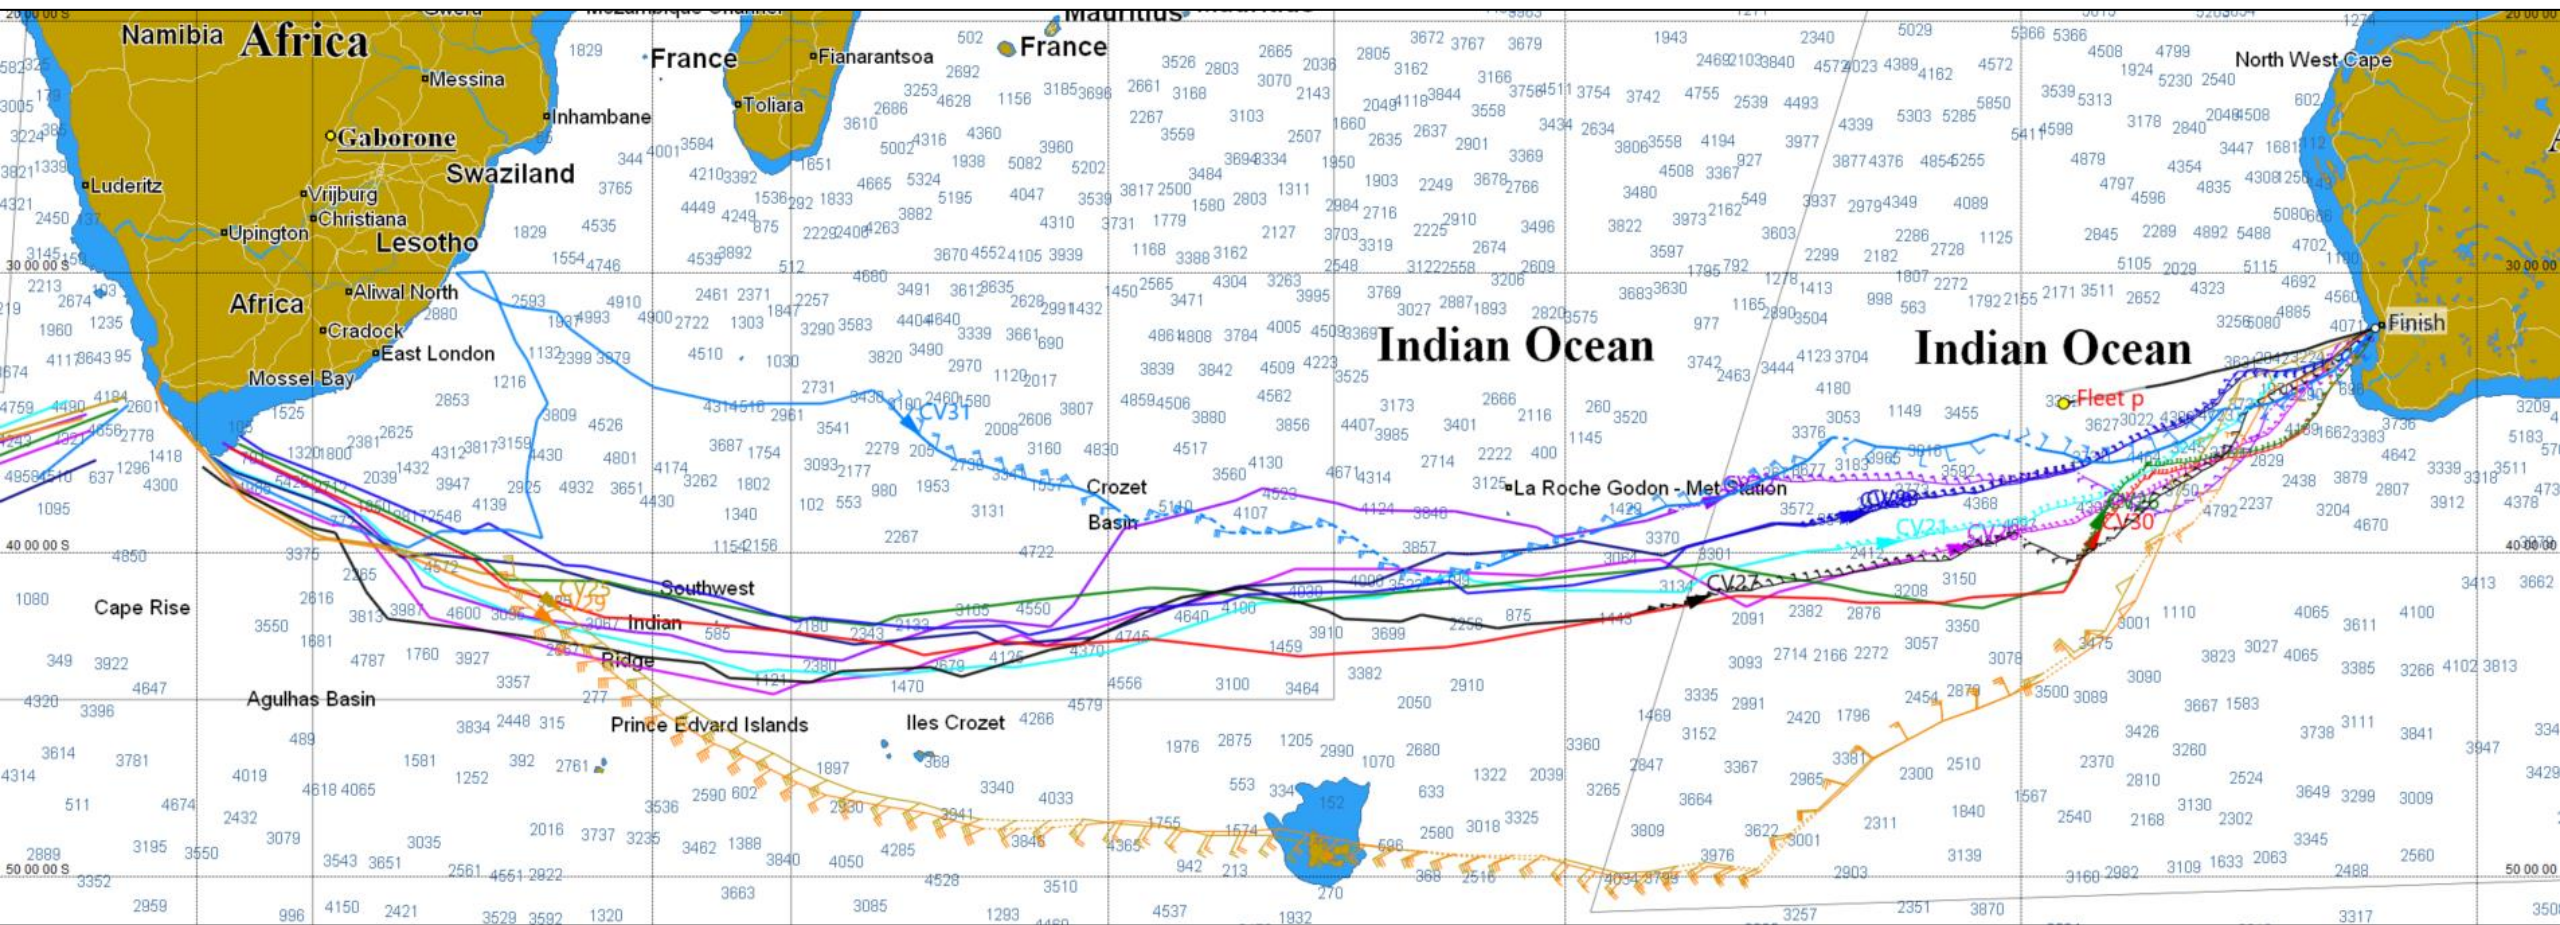

Simon Rowell Meng MSc

So much data – so little bandwidth.....

The Clipper Race – currently sailing towards Fremantle

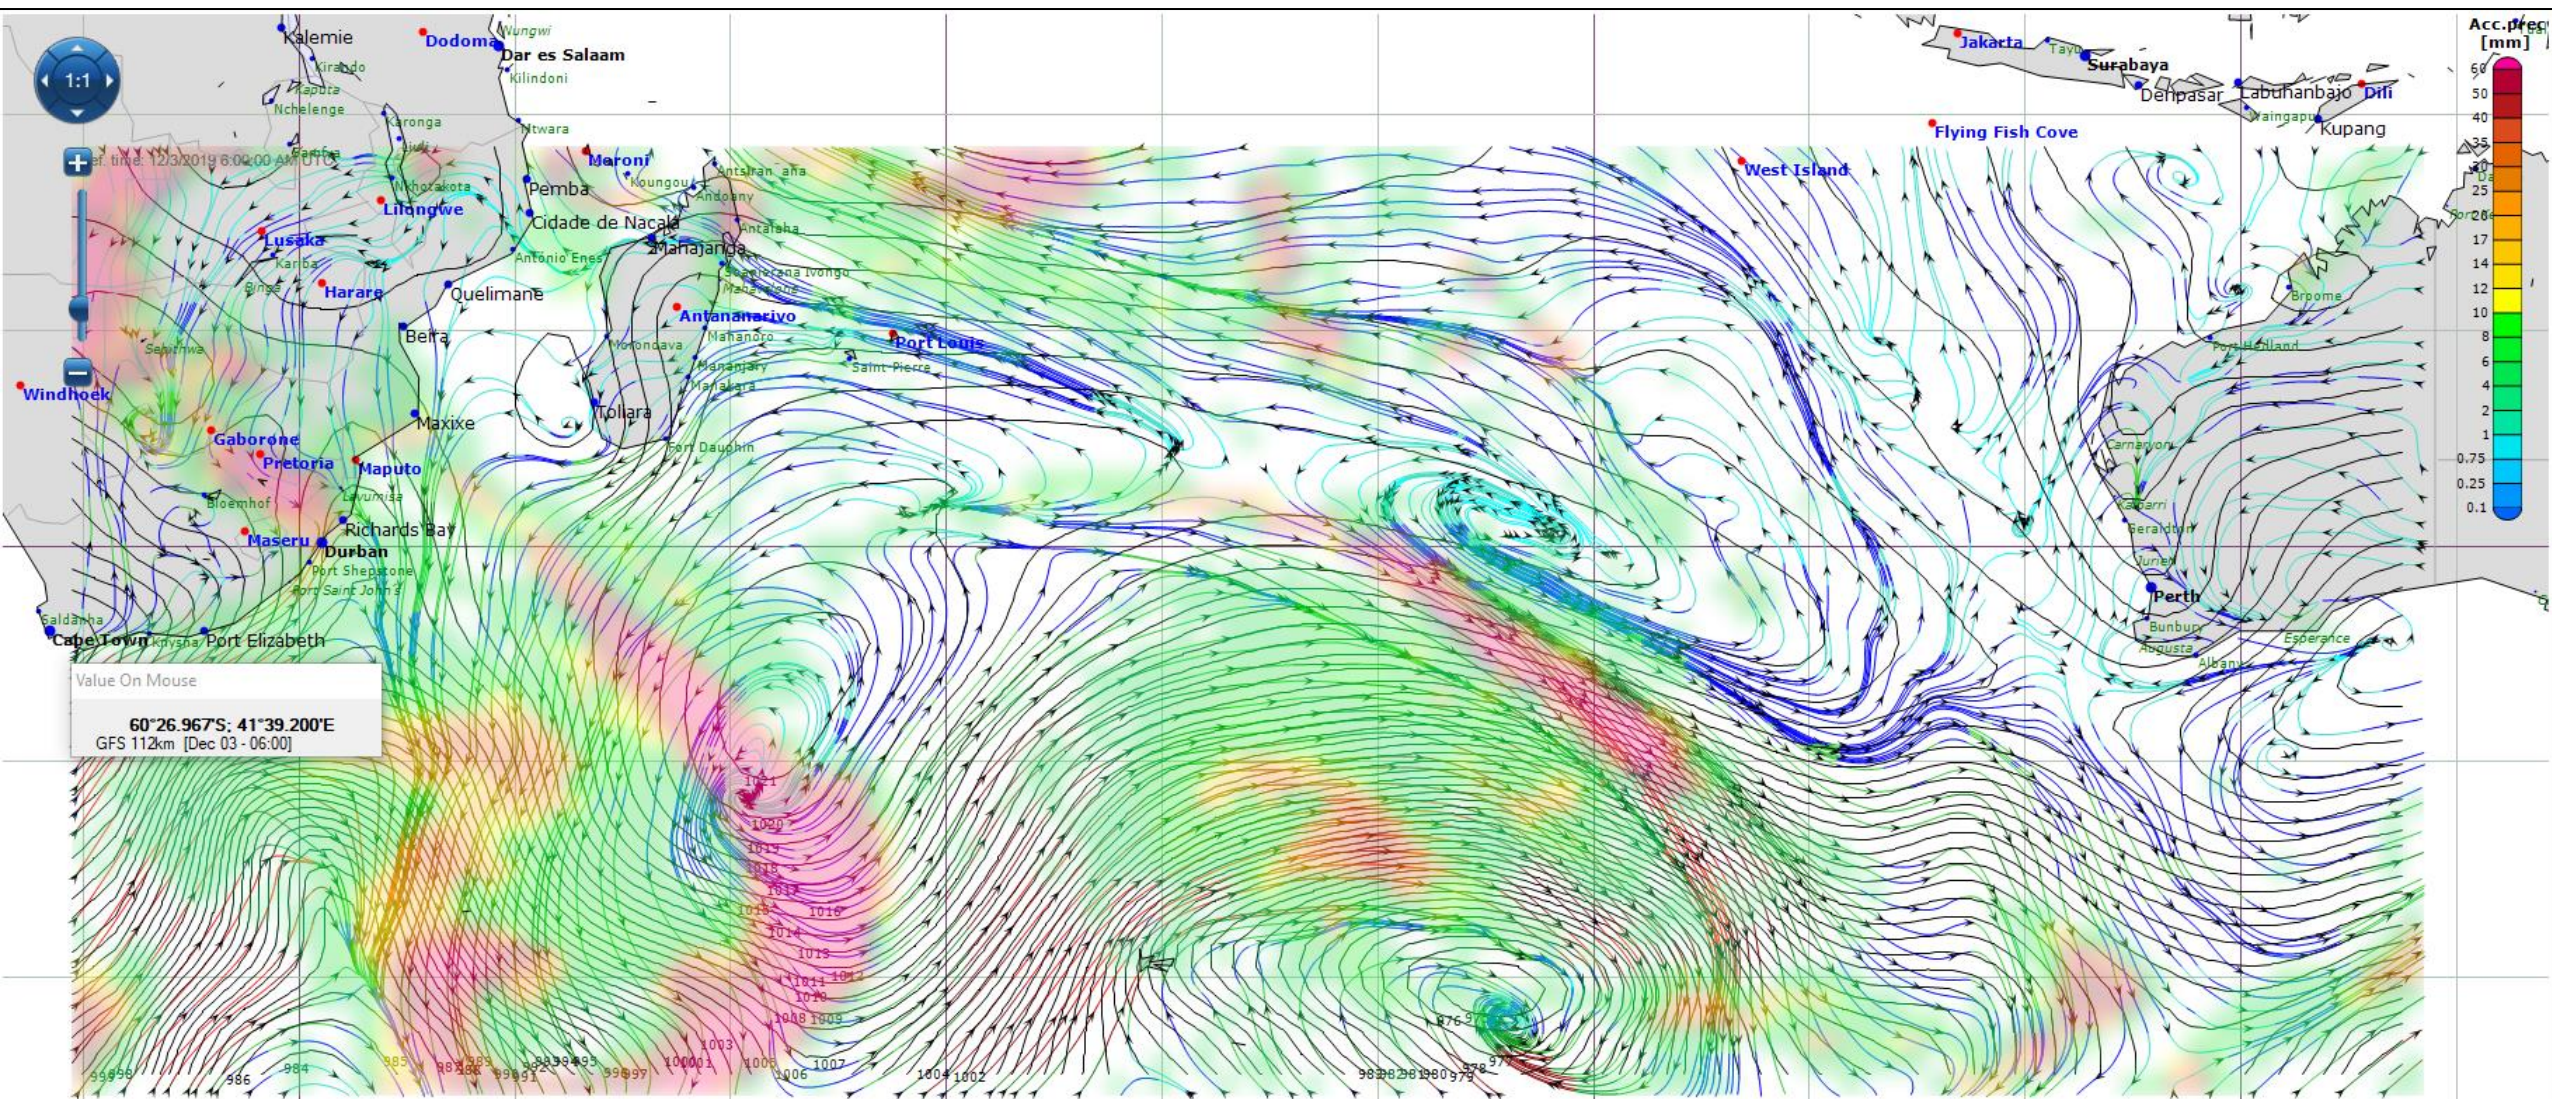

Positions as of 0600 UTC on Tuesday 3rd, with predicted routing onwards

Start with the Big Picture – ideally charts & satellite images

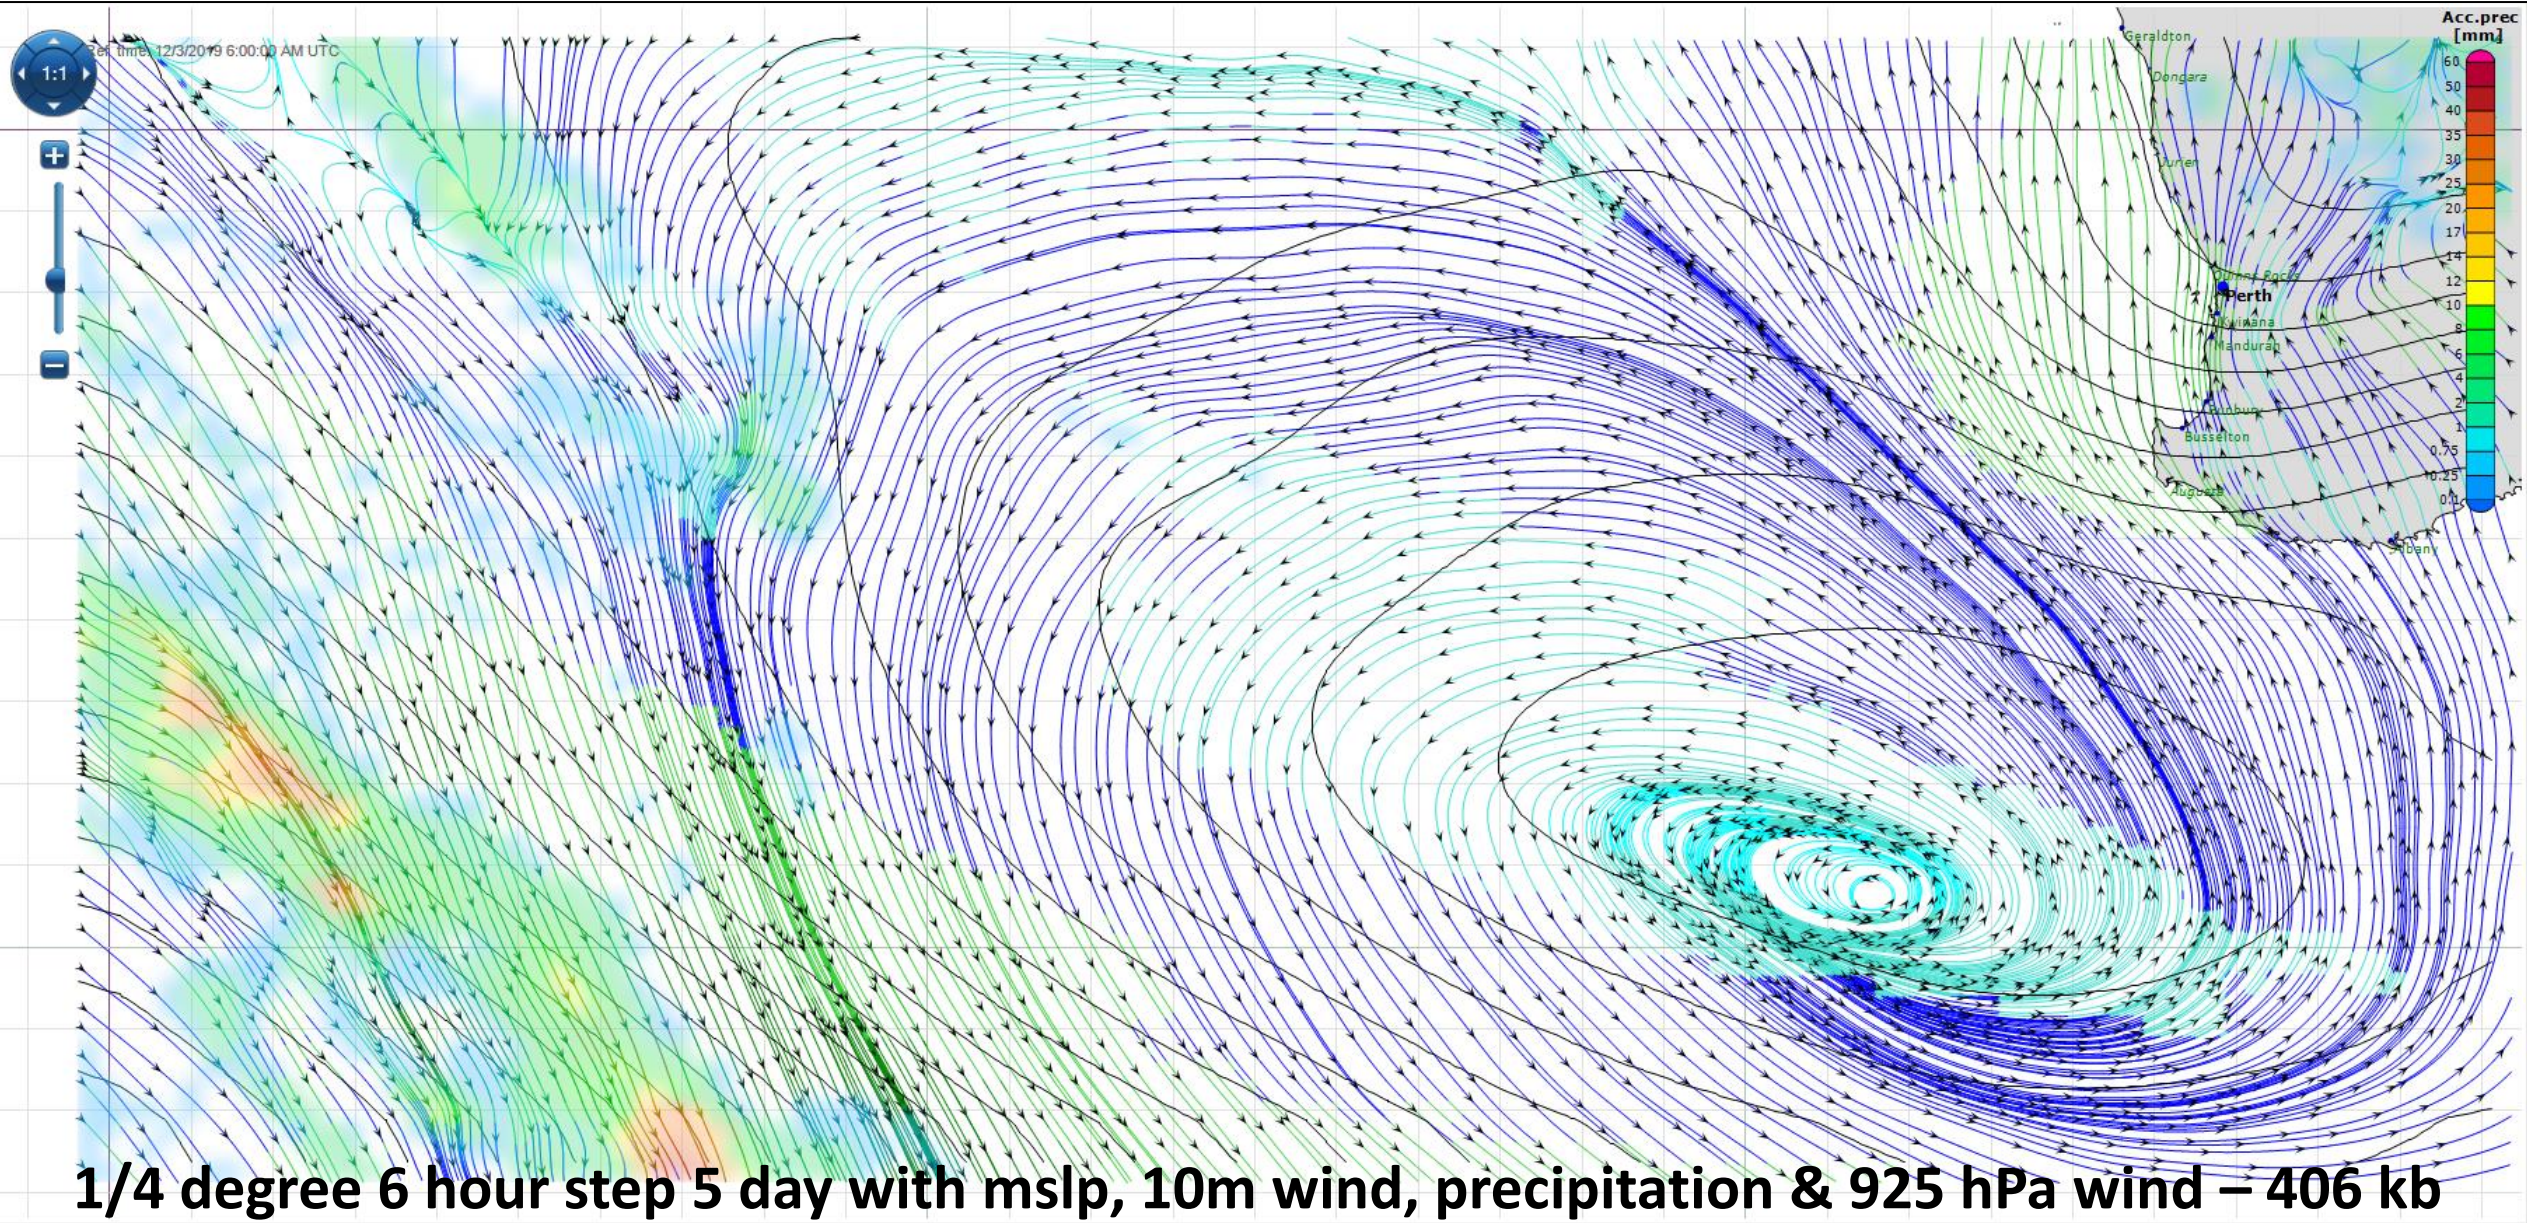

Start with the Big Picture – can you do it cheaply with GRIBs?

1 degree 24 hour step 7 day with mslp, 10m wind, precipitation & 925 hPa wind – 120 kb

Then use higher resolution for the next few days

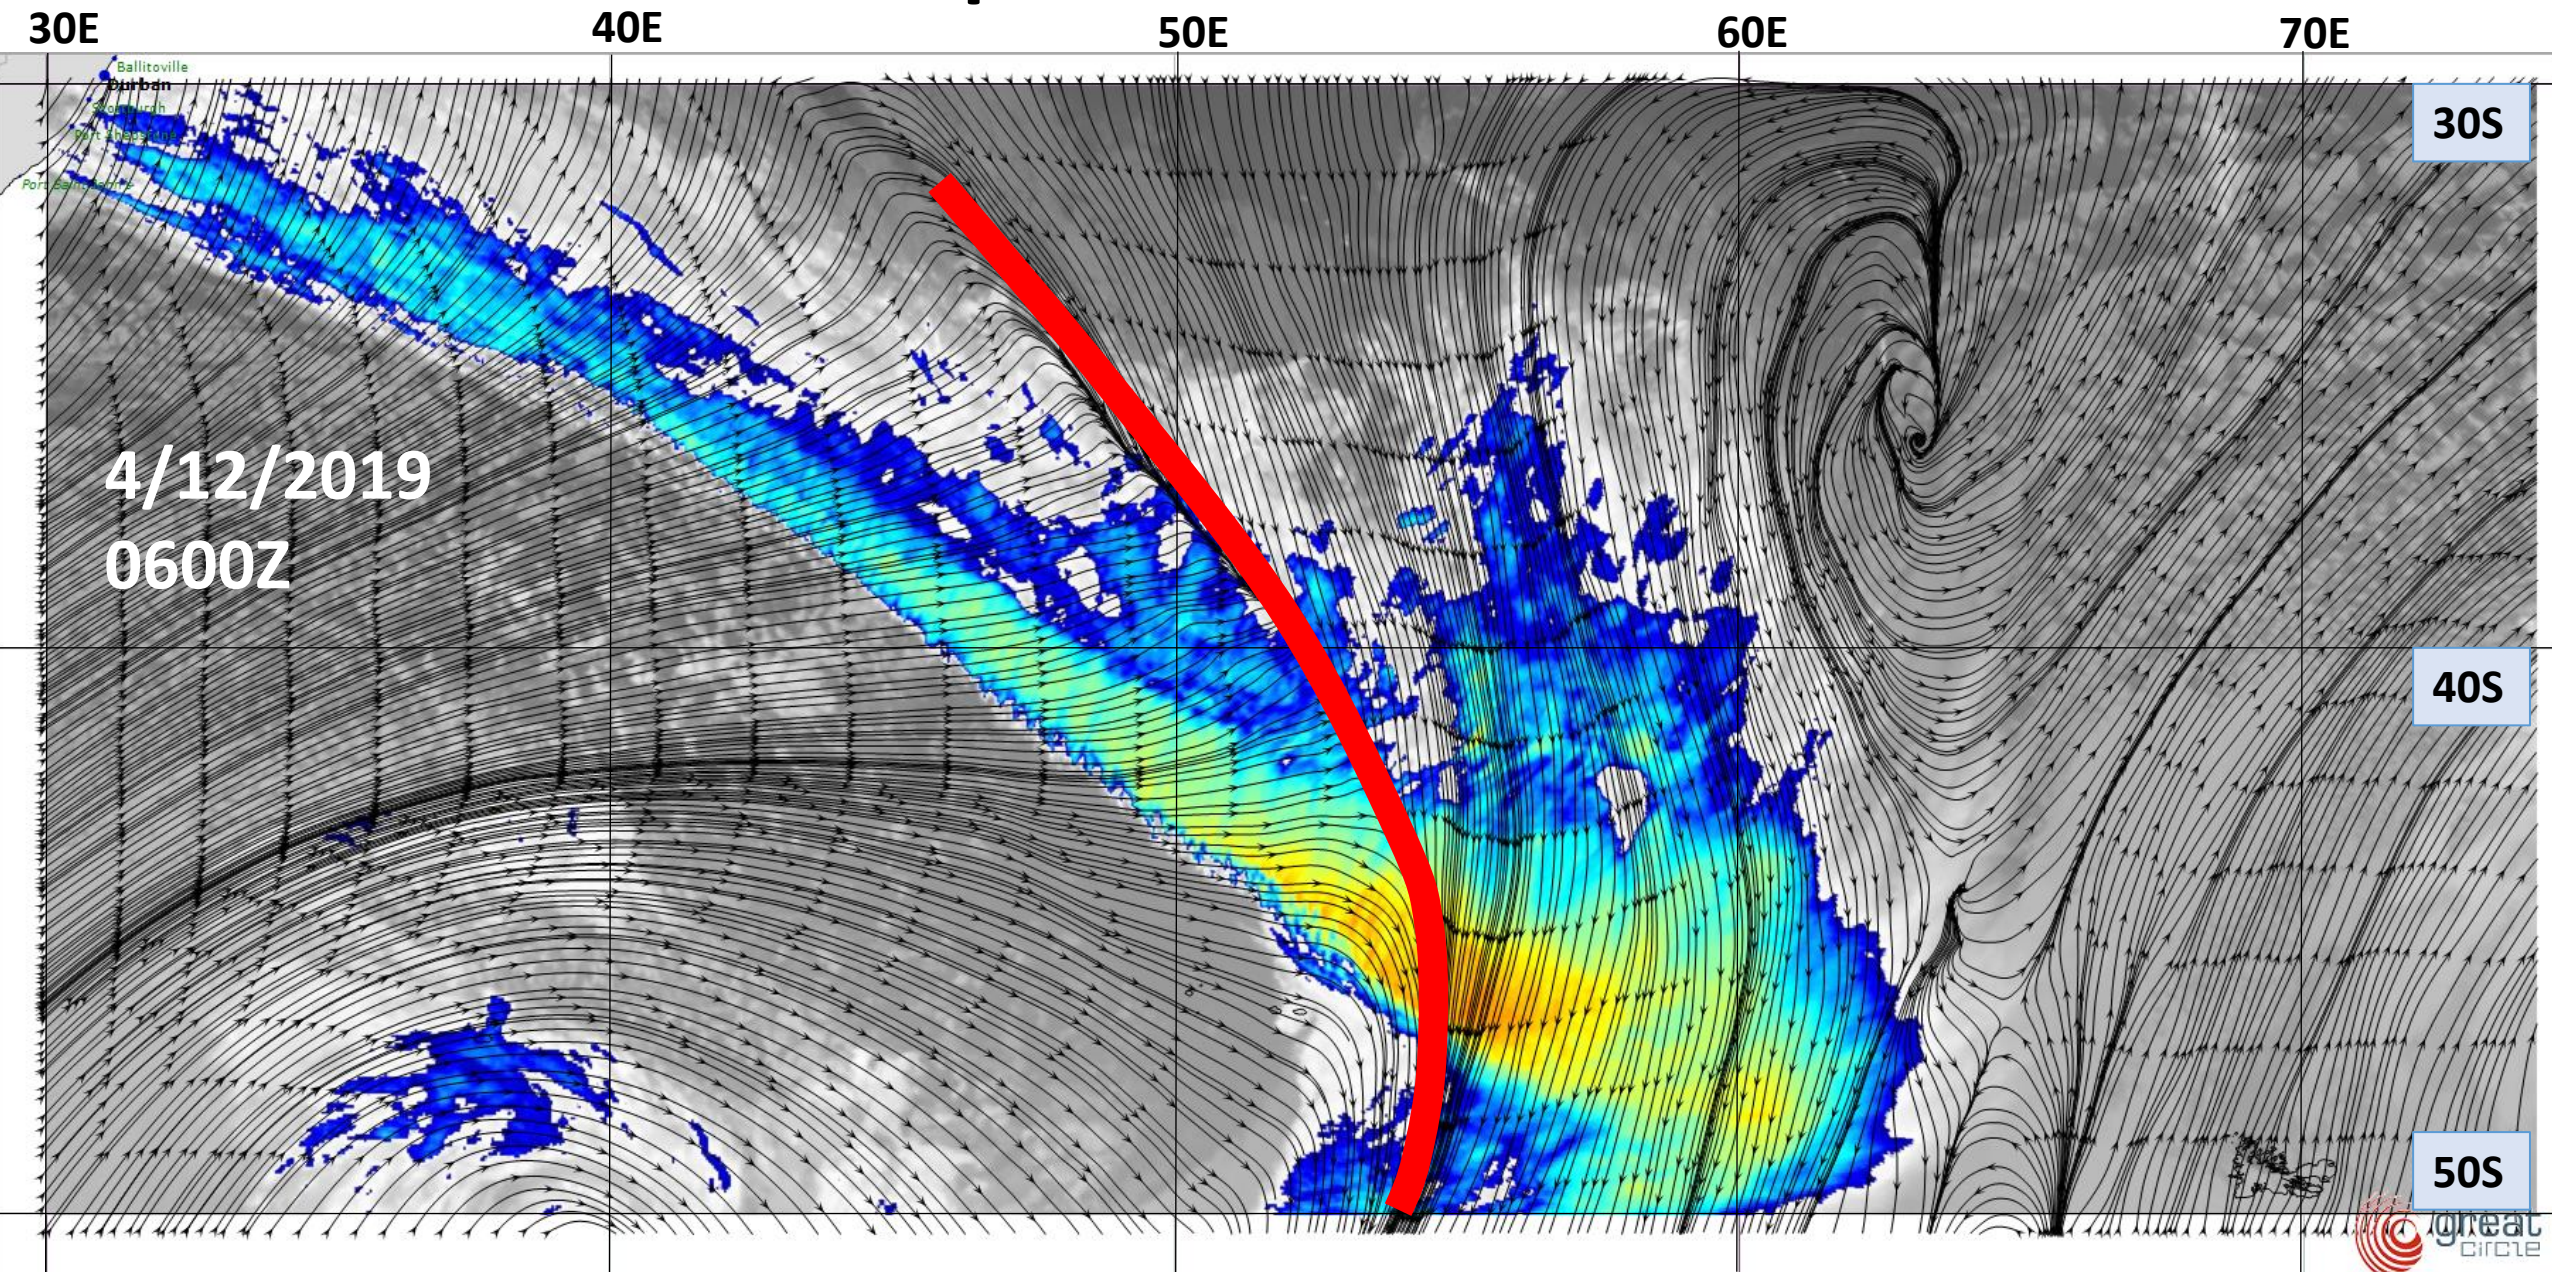

925 hPa winds for gust speed

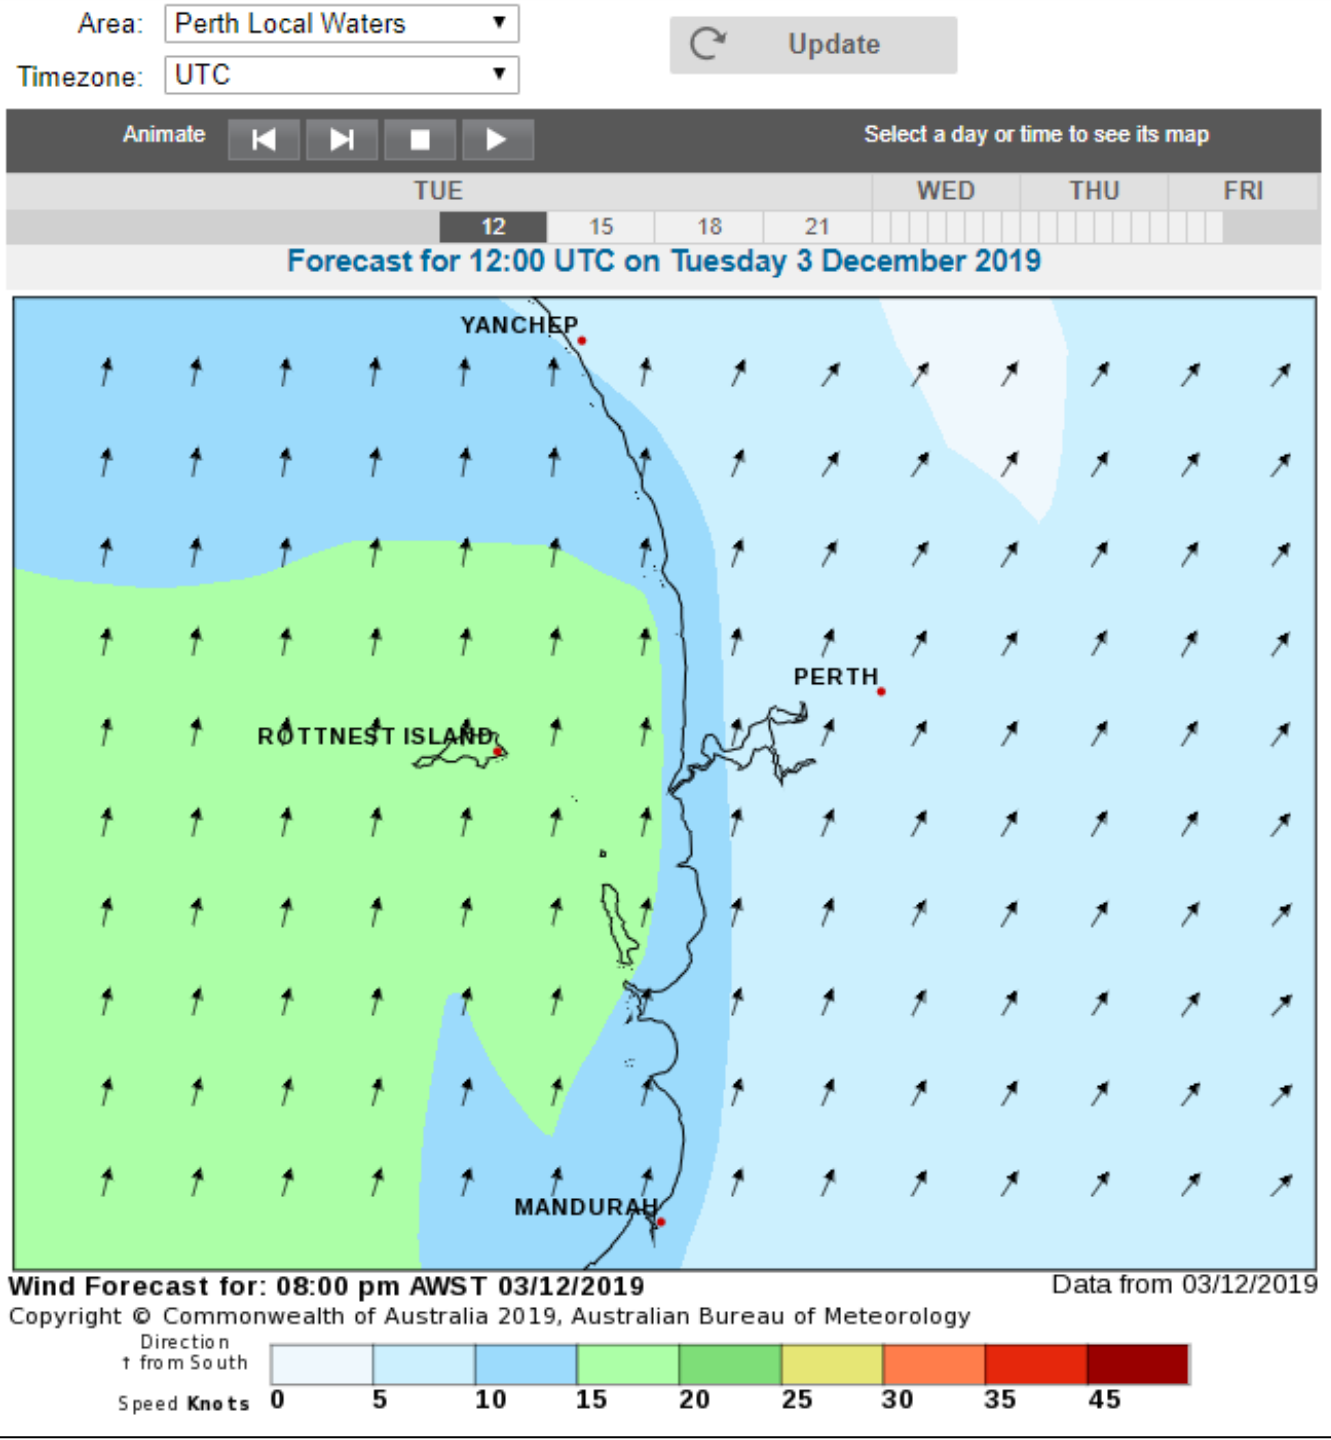

Local Satellite Image – 100 kB

Compare GRIBs to Actual

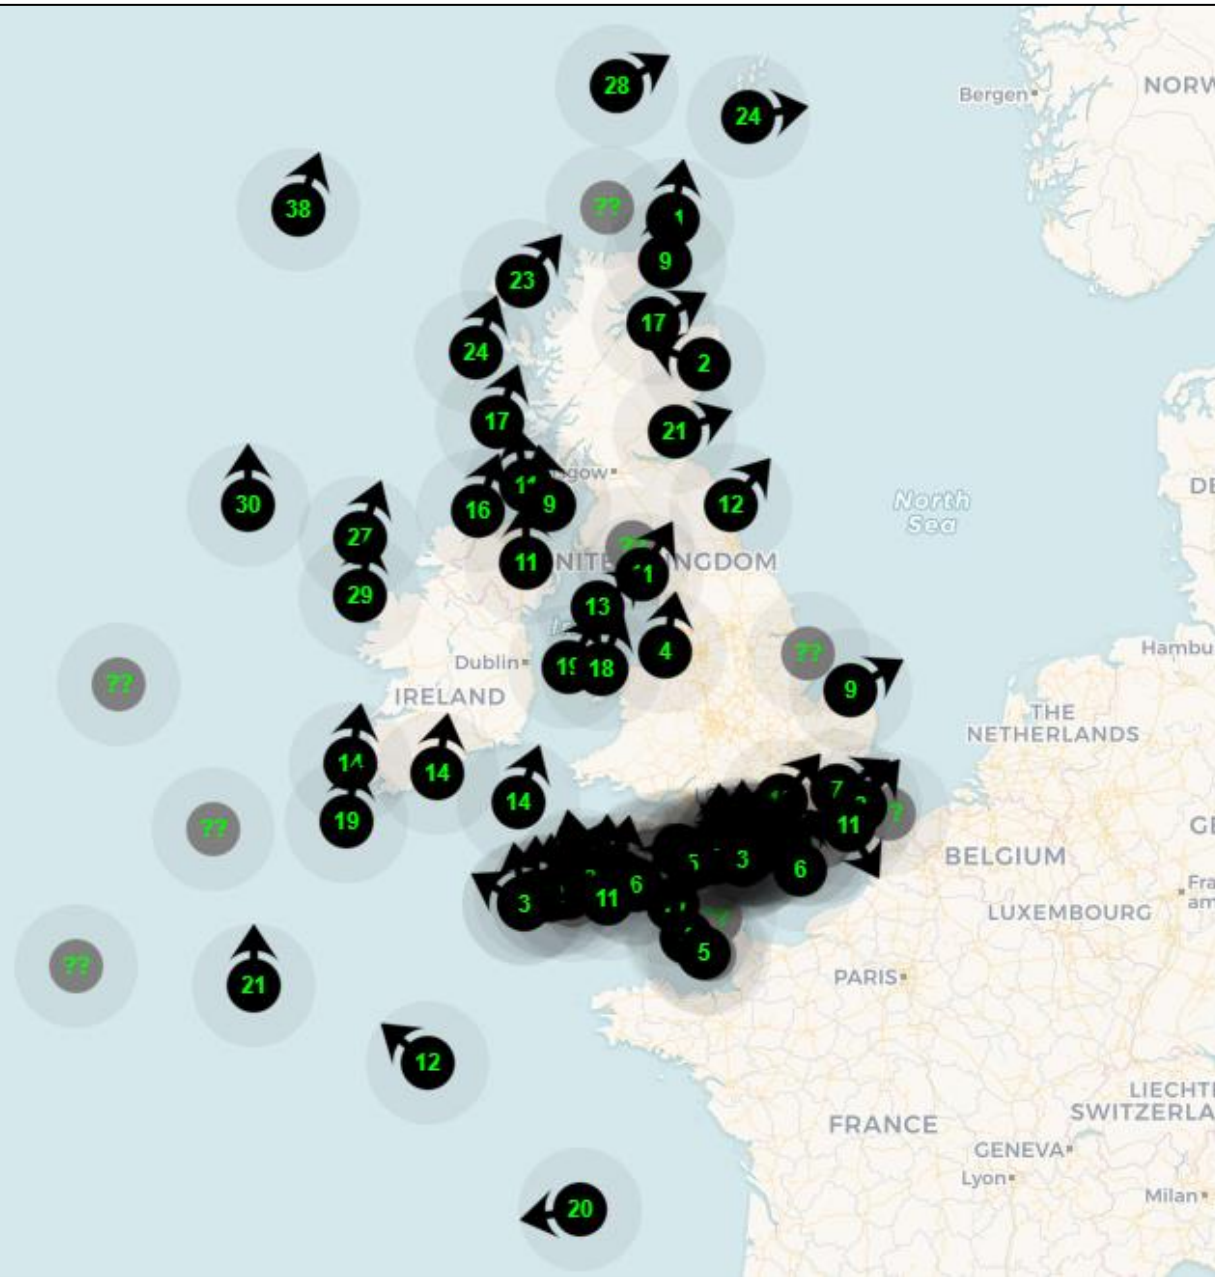

Higher Resolution as you get inshore

**ABoM ACCESS model,
approx. 4 km resolution
around Perth.**

**Only 24-36 hours ahead
though.**

Fill it in with as much Observation Detail as you can

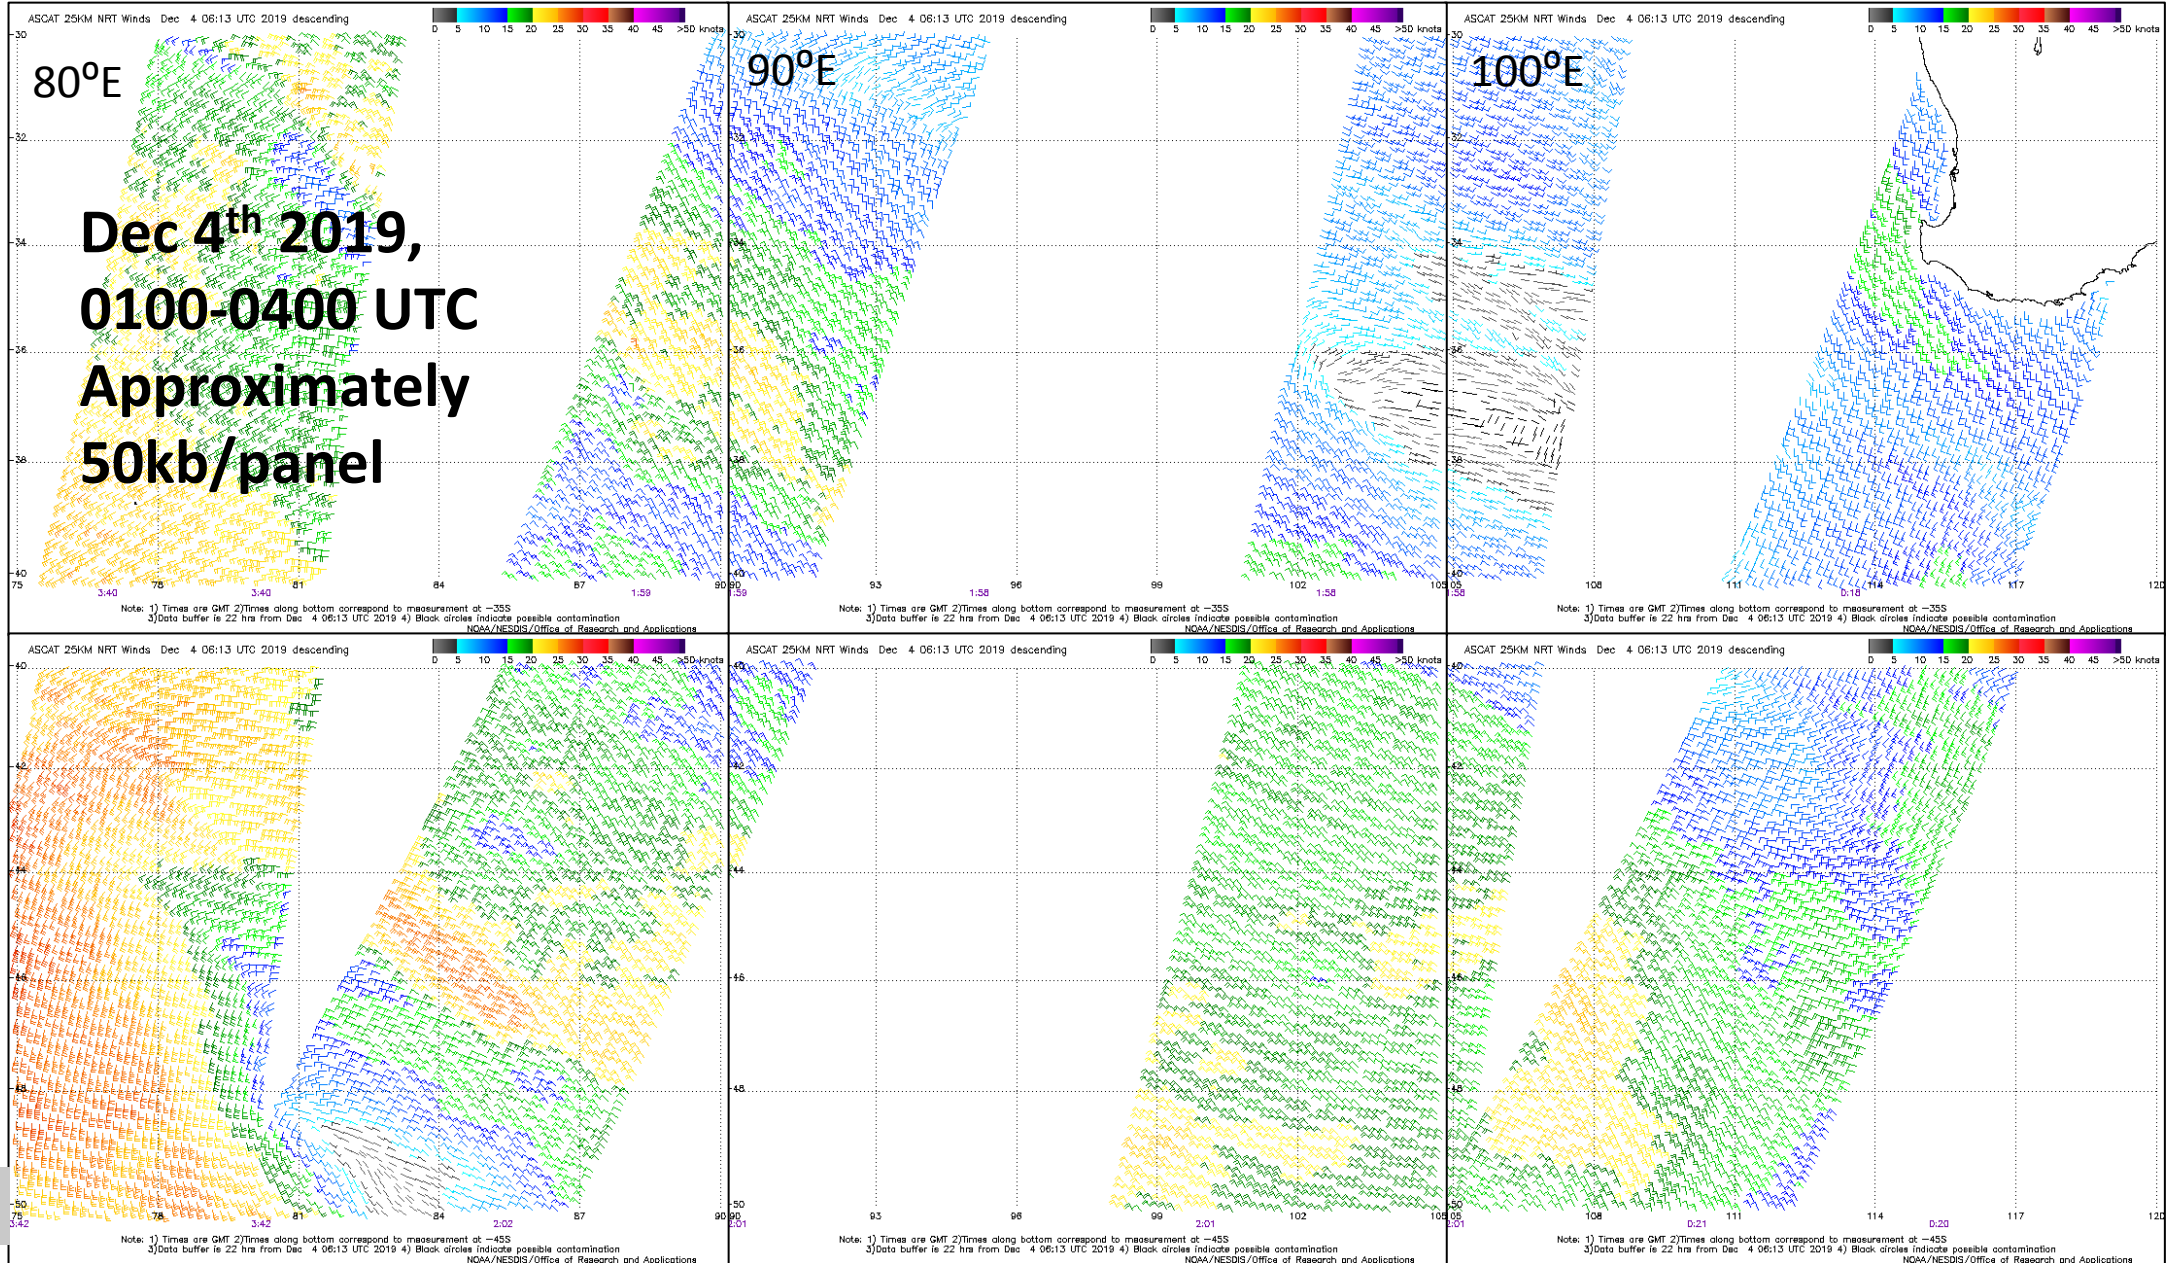

What about when you're mid-ocean? ASCAT scatterometer data

30°S

40°S

50°S

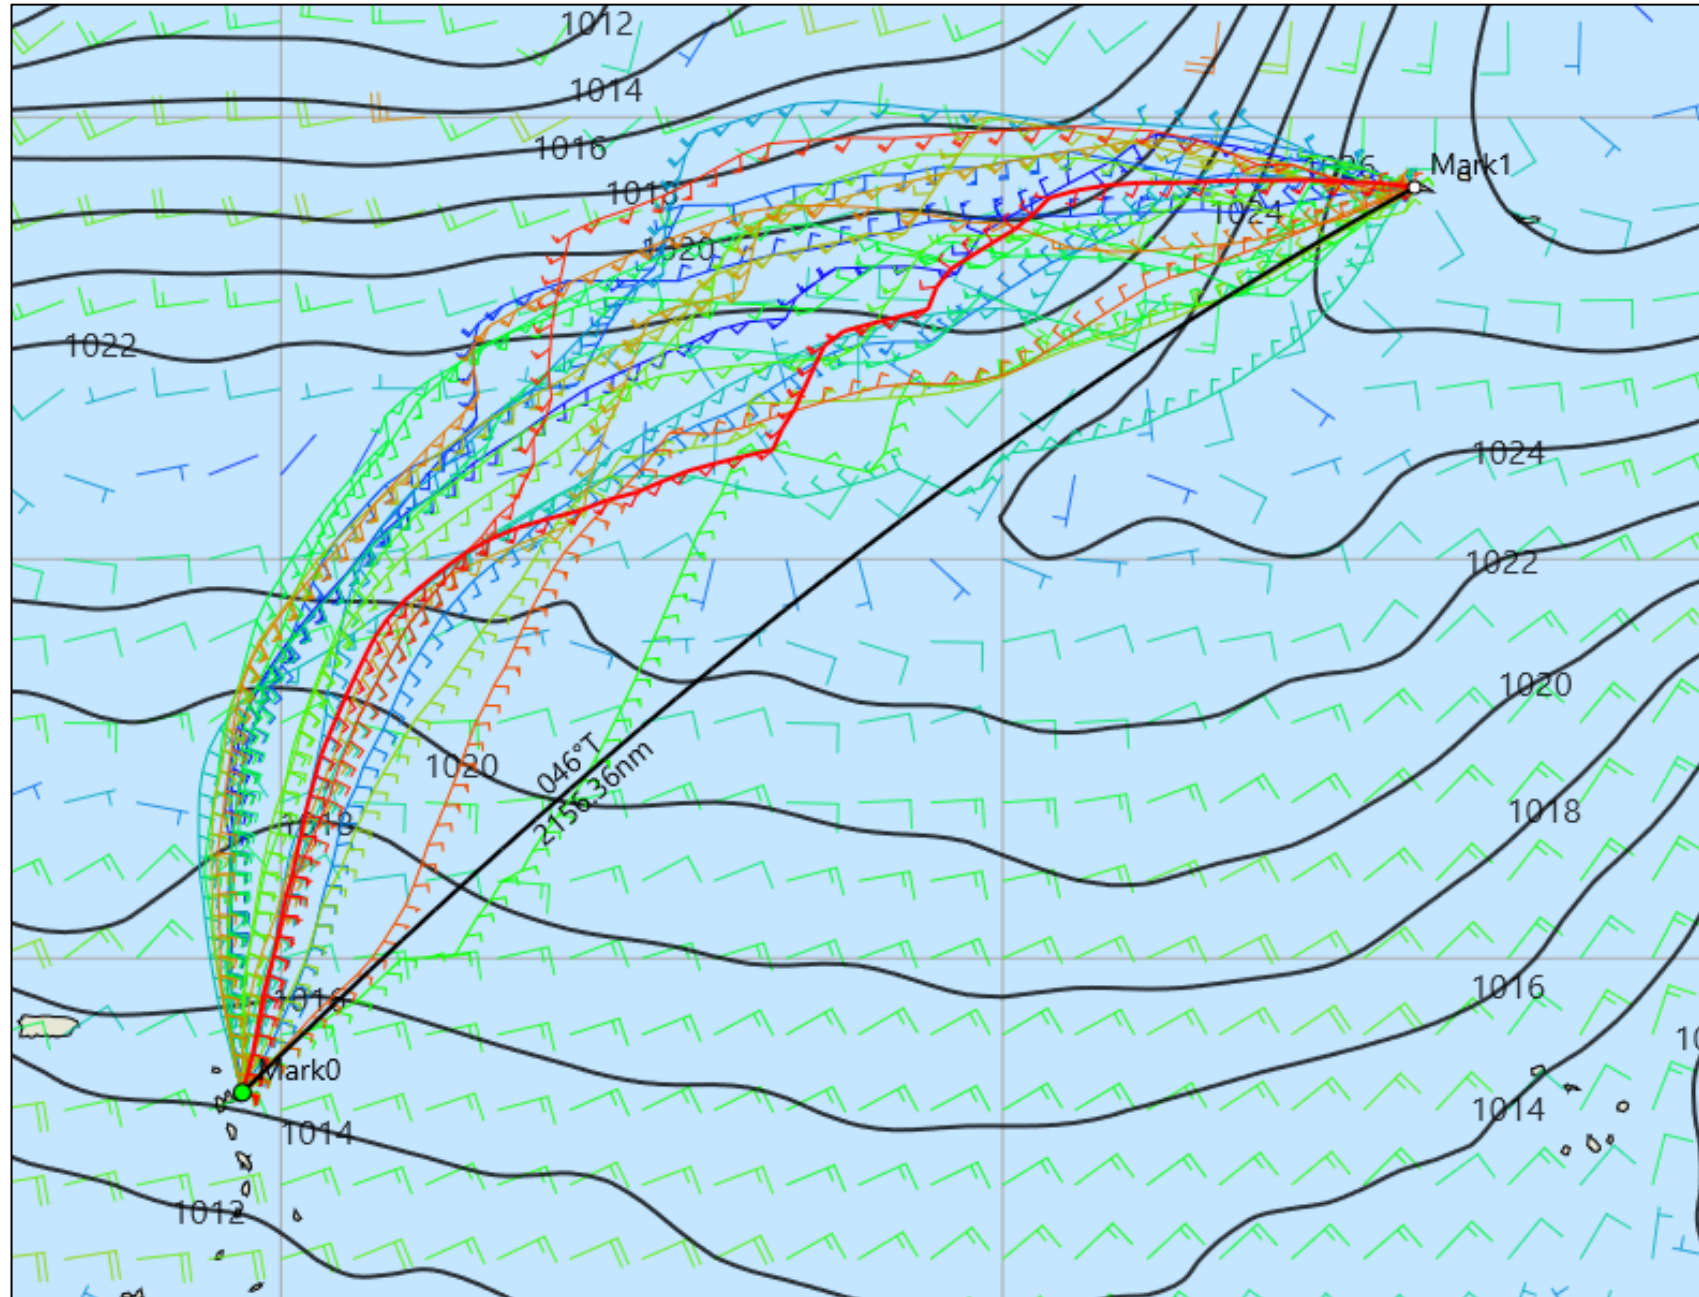

Ensemble Forecasts

ECMWF ENSEMBLE FORECASTS

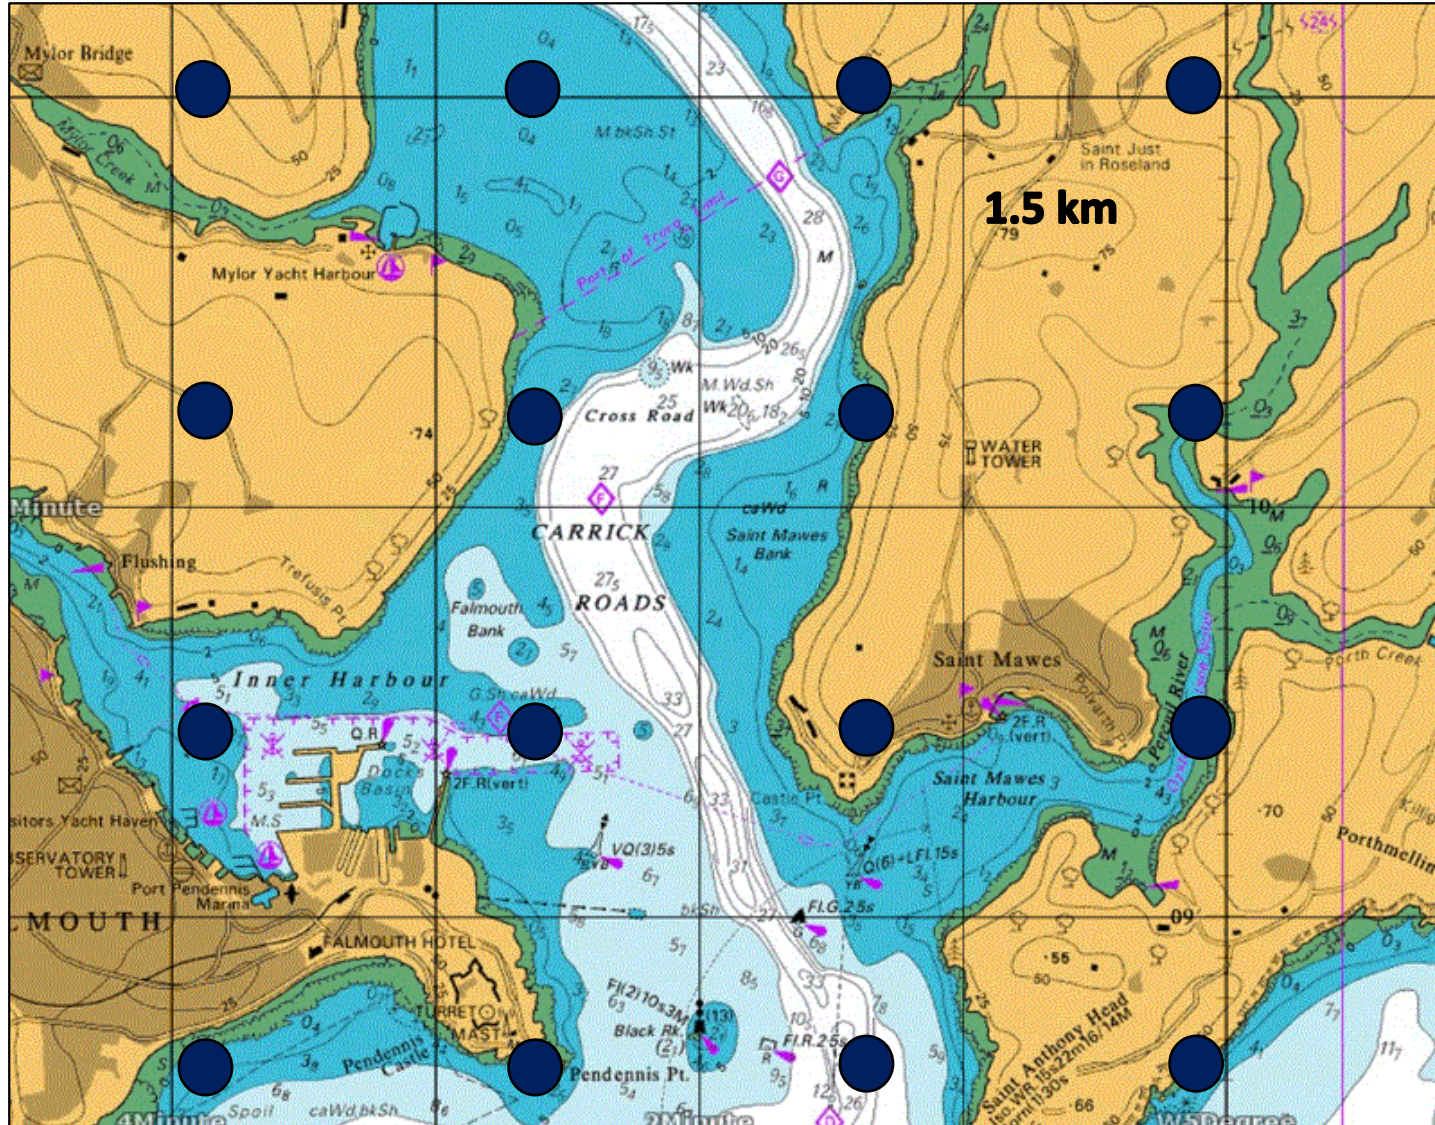

Wednesday 28 September 2011 00UTC ECMWF Forecast t+72 VT: Saturday 1 October 2011 00UTC Surface: Mean sea level pressure
MSLP (contour every 5hPa) and Temperature at 850hPa (only -6 and 16 isolines are plotted)

Ensemble Forecasts for pre-departure planning

What's the Model Resolution?

**GFS – ¼ degree output.
The global model has a 13
km grid**

**ECMWF has a 9 km
global grid**

**Met Office has a 10 km
global grid, 1.5 km over
& around the UK**

Why do we care about the Model Resolution?

Why do we care about the Model Resolution?

Why do we care about the Model Resolution?

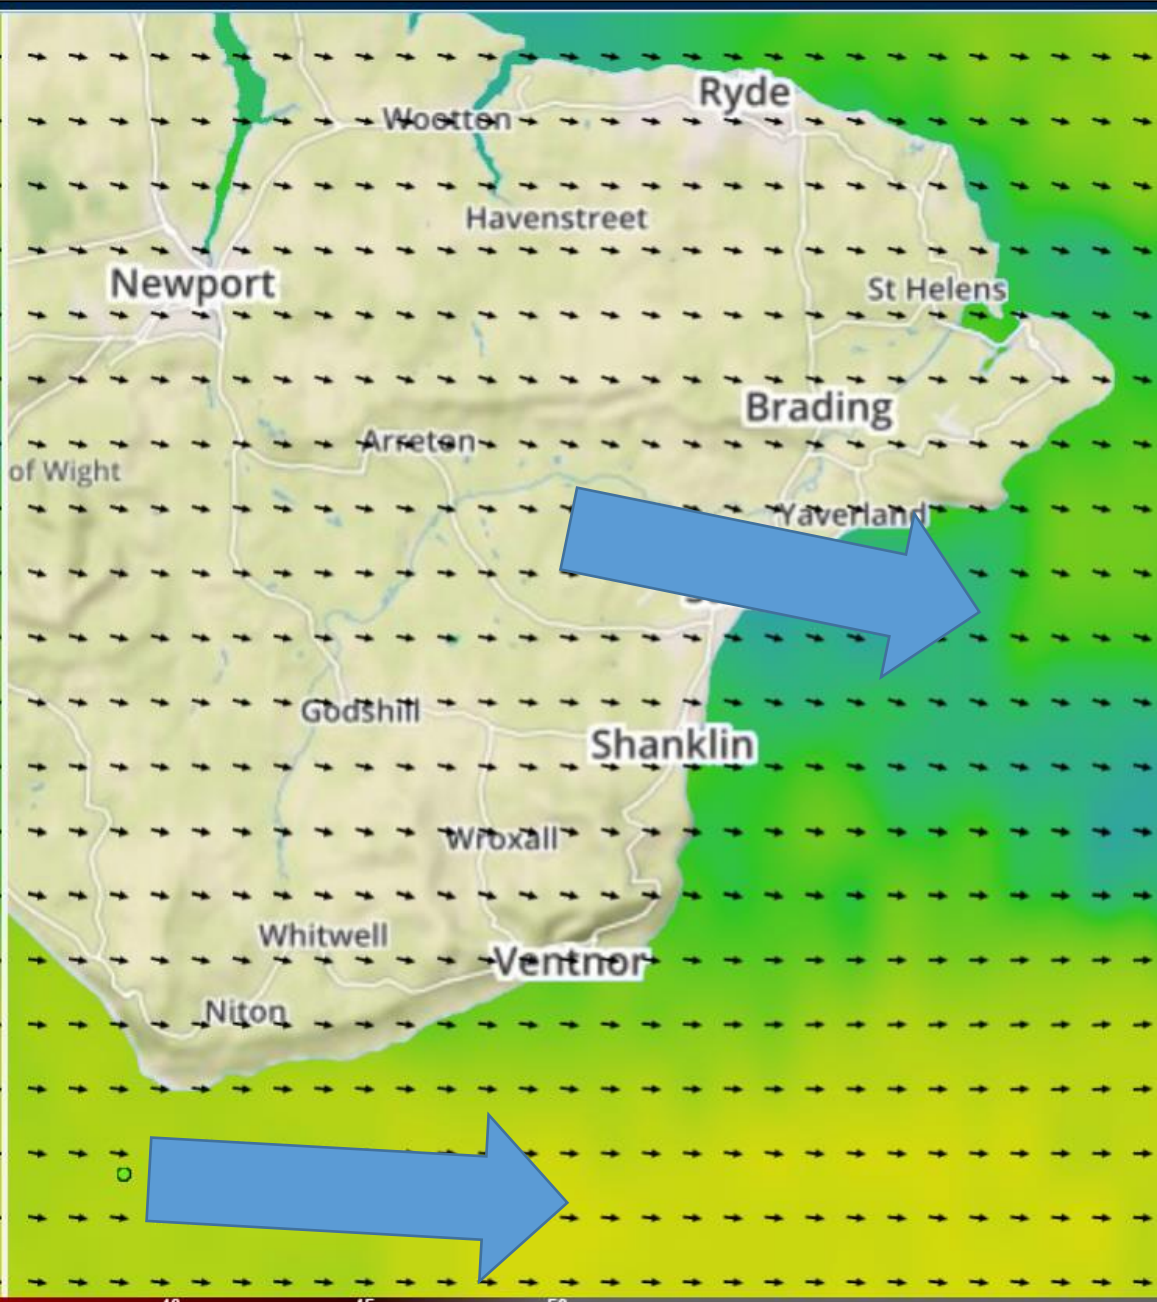

Why do we care about the Model Resolution?

Portland Bill & the Isle of Wight Exist!

**We've got our forecast – what about the
sub-grid stuff?**

[illegible]

**After Storm
Doris – still a
big acceleration
around
Portland Bill**

Squalls

Self-Sustaining Squalls

Wet microburst

- Dry air above the freezing level is carried down, often taking ice particles with it.
- This dry air immediately has moisture evaporate into it, cooling the air around it. Ice particles melt, also cooling the air further.
- **This negatively buoyant air accelerates downward, taking raindrops with it.**
- These often are carried faster than they would be if they just fell.

Microbursts, a Handbook for Visual Identification.

Caracena, Holle & Doswell 1990, US Dept of Commerce

Microburst in Queensland January 2015 (Peter Thomson)

A photograph taken from the deck of a ship, looking out over the ocean. A wooden mast with black rigging lines runs diagonally from the bottom left towards the top center. A white vertical pole is visible on the right side. The sea is dark blue with white foam from the ship's wake. The sky is filled with heavy, grey clouds, with a brighter area on the right side.

Just before a microburst, June
2019 in the Skagerrak

Atlantic, under the
N Atlantic High

Virga

Virga: wisps of descending air, with moisture evaporating as it comes down – potential for development.

- Use synoptics & satellite images to match forecast with actual
- Use GRIBs at a practical level of detail
- Use the various outputs to get an idea of the overall shape of the systems
- Think sub-grid – what's it actually going to do?
- Use your weather eye to look at the clouds – sometimes obvious (really deep, really dark), sometimes not (virga)
- And, most importantly

If it Looks Like an Elephant Turn Left!

Thanks very much – questions please!
